Financial periods and how to work with them

FINANCIAL FORECASTING IN PYTHON

Victoria Clark
CGMA Financial Analyst

The financial year

- Full reporting year for financial numbers
- Can start and end at any month of the year
 - e.g., Microsoft Financial Year is 1 July 30 June

2017

1ST QUARTER

January s M T W T F S 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24 25 26 27 28 29 30 31

| 3 | 4 | 5 | 6 | 7 | 8 | 9 | | |
| 10 | 11 | 12 | 13 | 14 | 15 | 16 | | |
| 17 | 18 | 19 | 20 | 21 | 22 | 23 | | |
| 24 | 25 | 26 | 27 | 28 | 29 | 30 | | |
| 31 | | | | | | | | |
| | | | | | | | | |

Abbreviations

- Months
 - 01, 02, 03 or Jan, Feb, Mar
 - Not dependent on financial year
- Quarters
 - Q1, Q2, Q3, Q4
 - Dependent on financial year
- Years
 - 2017, 2018 or 18, 17
 - Year is set based on the financial year end

Let's practice!

FINANCIAL FORECASTING IN PYTHON

The datetime library and Split function

FINANCIAL FORECASTING IN PYTHON

Victoria Clark
CGMA Financial Analyst

Types of conflicts

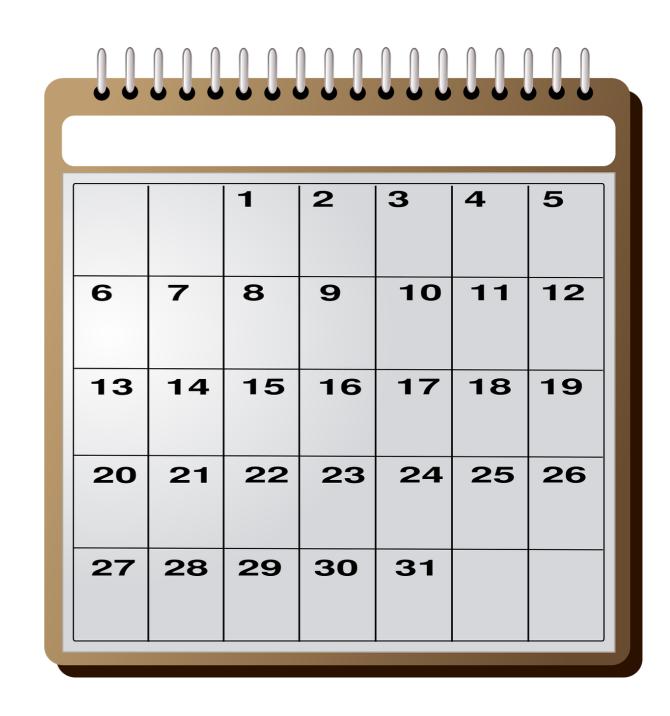

Date: 09/10/2018

Regional differences

- Day-Month-Year
- Month-Day-Year

Punctuation differences

- dd-mm-yy
- dd/mm/yyyy

The datetime function

```
12-25-2000 --> %m-%d-%Y'
```

| Directive | Meaning | Example |
|-----------|--|---------------------------|
| %d | Day of the month as a zero- padded decimal number | 01, 02,, 31 |
| %b | Month as locale's abbreviated name | Jan, Feb,, Dec |
| %B | Month as locale's full name | January,, December |
| %m | Month as a zero-padded decimal number | 01, 02,, 12 |
| %у | Year without century as a zero- padded decimal number | 00, 01,, 99 |
| %Y | Year with century as a decimal number | 1970, 1988, 2001, 2013 |

12

Using the split() function

• split() function

```
date = '14/02/2018'
# Split date string into named variables using /
day, month, year = date.split('/')
print(year)
```

2018

Let's practice!

FINANCIAL FORECASTING IN PYTHON

Tips and tricks when working with datasets

FINANCIAL FORECASTING IN PYTHON

Victoria Clark
CGMA Financial Analyst

Common challenges when working with financial data

- Raw data is in different formats
- Date format can be different!
 - US format is Month-Day-Year, EU is Day-Month-Year
 - 09-08-2018 in US is the 8th of September, EU is 9th of August
- Can cause challenges in:
 - Interpreting
 - Combining

Using a dictionary

- Dictionary: associative array
- Keys are mapped to values
- un-ordered key-value-pairs
- For example:
 - The value 01 has a key of Jan

```
dictionary = {01: 'Jan'}
```

Remember to use the datetime library

| Directive | Meaning | Example |
|-----------|--|------------------|
| %d | Day of the month as a zero-padded decimal number | 01, 02,, 31 |
| %b | Month as locale's abbreviated name | Jan, Feb,, Dec |
| %B | Month as locale's full name | January,, |
| %m | Month as a zero-padded decimal number | 01, 02,, 12 |
| %y | Year without century as a zero-padded decimal number | 00, 01,, 99 |
| %Y | Year with century as a decimal number | 1988, 2001, 2013 |

```
# Example: 19-02-2018 will be written: ('19-02-2018', '%d-%m-%Y')
```

Iterate over items

• iteritems() function

```
# Create dictionary with strings as keys
# and ints as values
wordFrequency = {
    "Hello" : 7,
    "hi" : 10,
    "there" : 45,
    "at" : 23,
    "this" : 77
    }
```

```
# Iterate over dictionary using for loop
for key in wordFrequency:
   value = wordFrequency[key]
   print(key, " :: ", value)
```

```
Hello :: 7
there :: 45
at :: 23
this :: 77
hi :: 10
```
